

## PS\_PRJ

Faza 1:

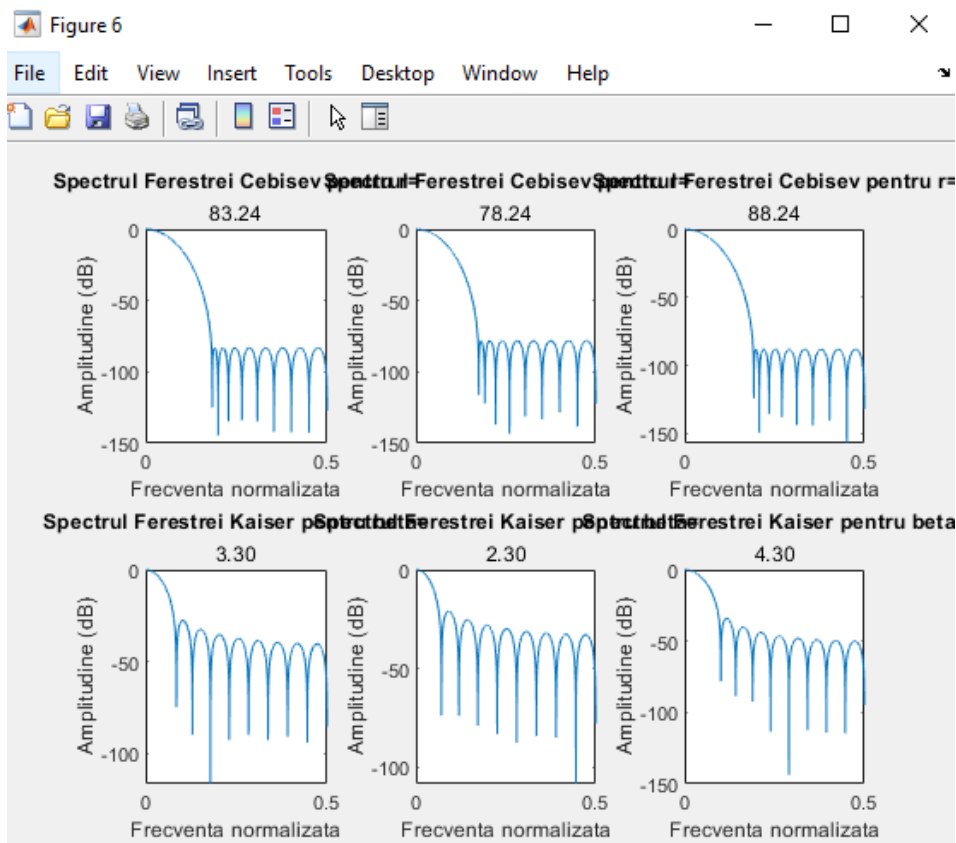

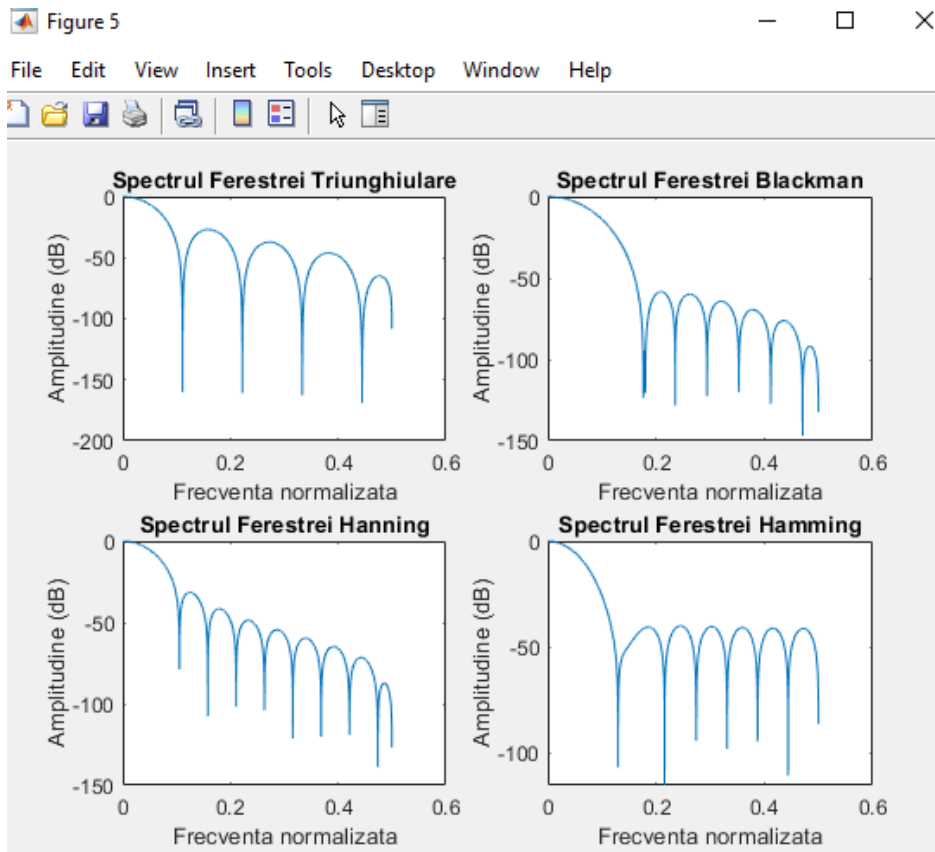

a)

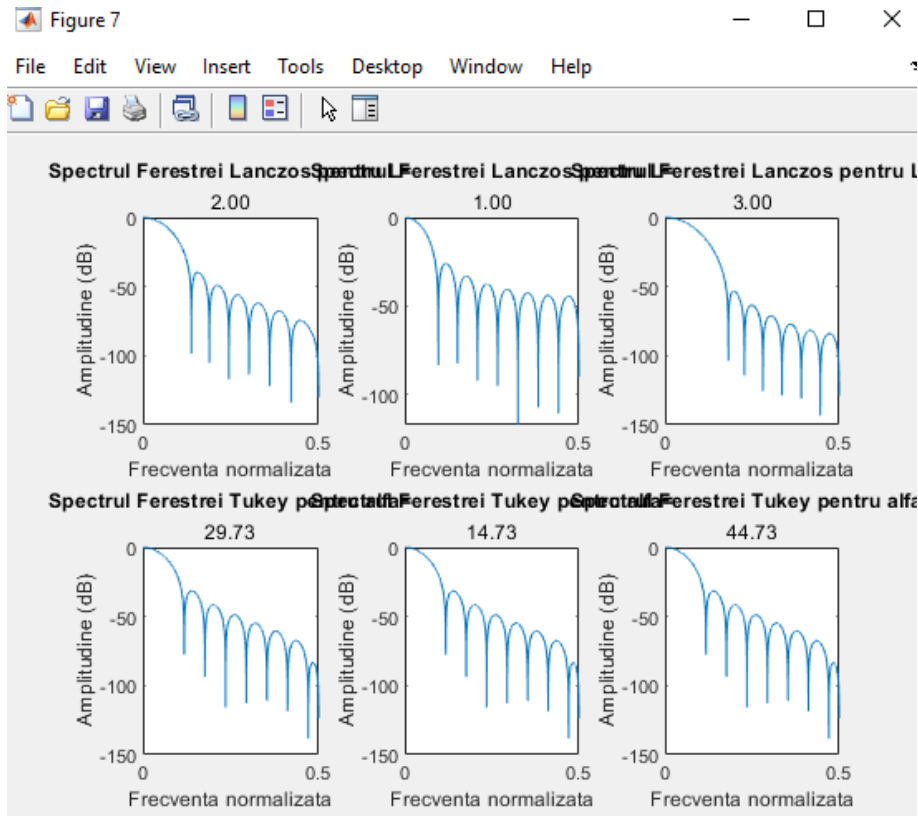

b)

c)

1.Fereastra dreptunghiulara:

Lobul principal aproape ca nu se diferentiaza de cei secundari, avand o latime aproape egala, si o inaltime putin mai mare

2.Fereastra triunghiulara:

Asemnator ferestrei dreptunghiulare, lobul principal este lat, iar cei secundari au intaltimele aproape la fel de mari cu lobul principal

3.Fereastra Blackamn:

Lobul principal al acestei ferestre este foarte lat, dar inaltimea mica a lobilor secundari imbunatateste situatia

4.Fereastra Hanning:

Comparand cu ferestrele de mai sus, fereastra Hanning are latimea lobului principal mai mica, si valorile lobilor secundari relativ mici

5.Fereastra Hamming:

In comparatie cu fereastra Hanning lobul principal este mai lat, dar lobii secundari au valori mai mici, deci le pot clasa in aceeasi categorie de calitate

6.Fereastra Cebisev:

Lobul principal este lat, dar valorile lobilor secundari sunt foarte scazute, ceea ce o face de o calitate destul de buna

### 7.Fereastra Kaiser:

Lobul principal ingust si valorile scazute ale lobilor secundari, o fac probabil cea mai calitativa fereastra dintre cele 9

### 8.Fereastra Lanzsos:

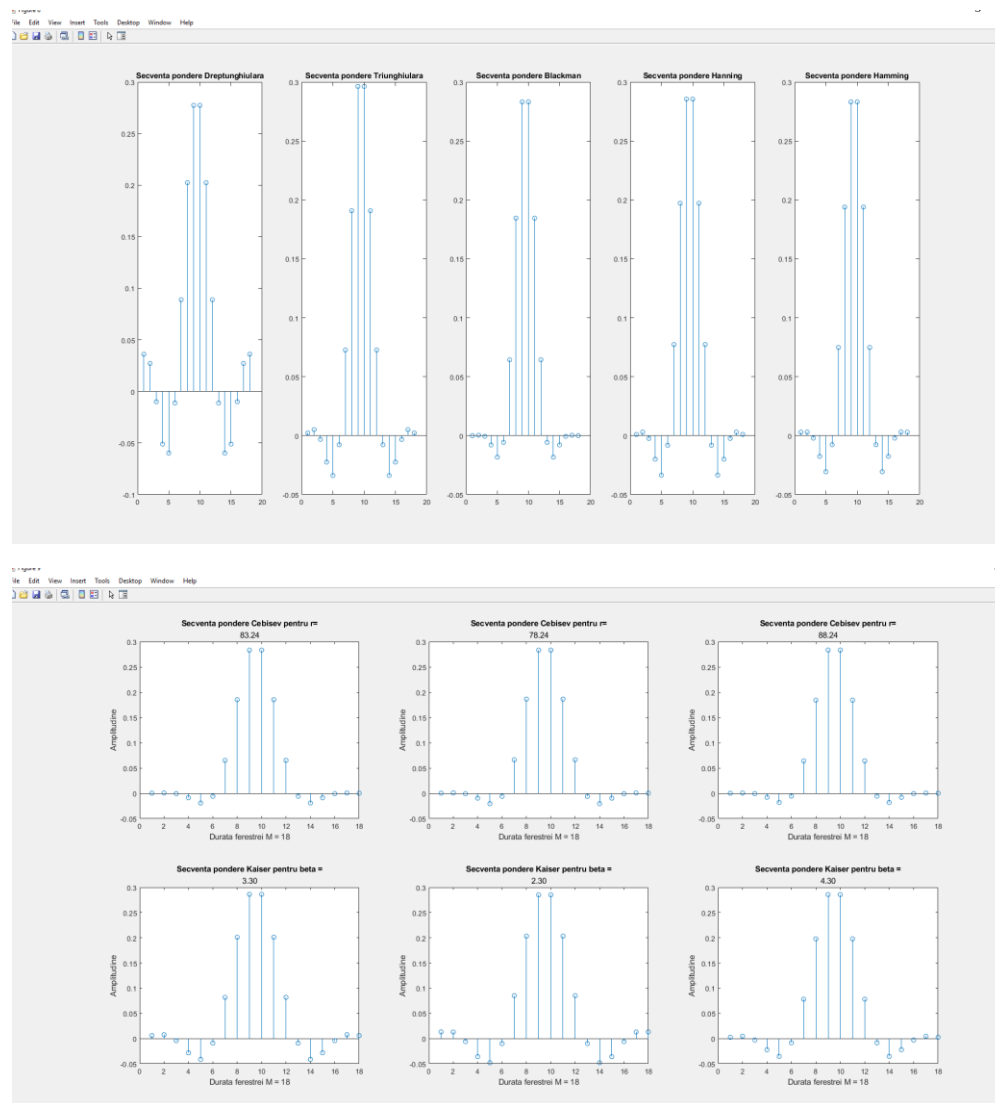

Calitate asemanatoare ferestrei Cebisev, poate putin mai buna, lobul principal fiind mai ingust, dar valorile lobilor secundari fiind putin mai mari

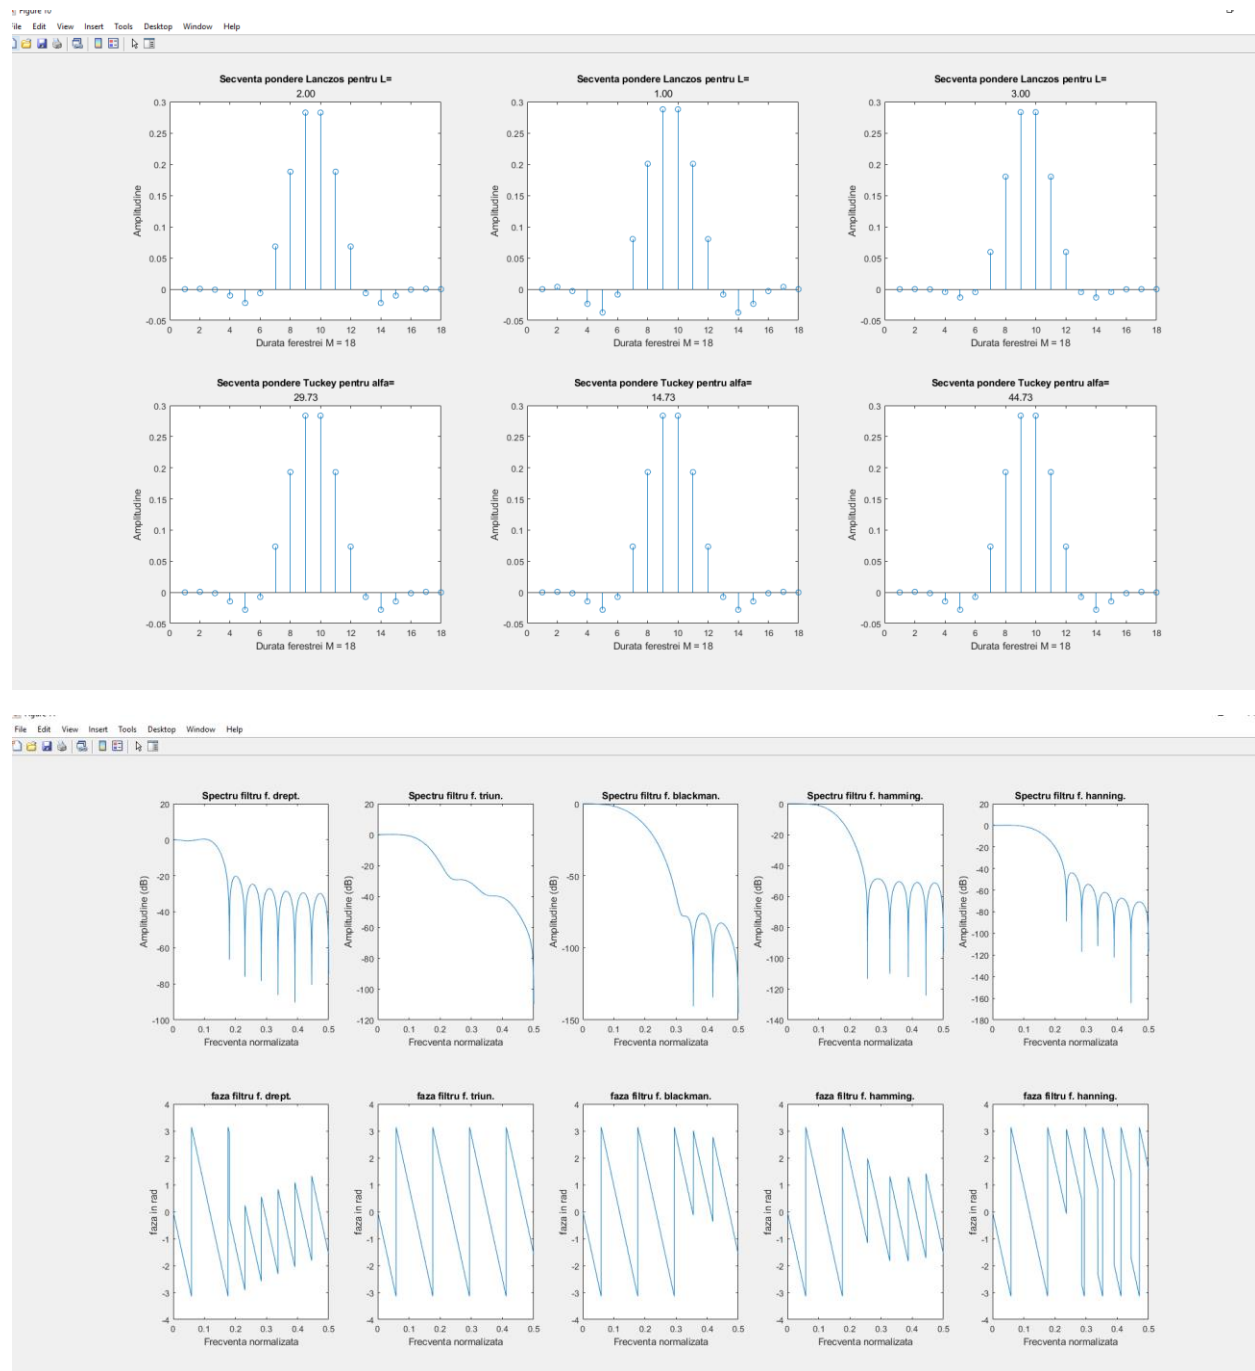

### 9.Fereastra Tukey:

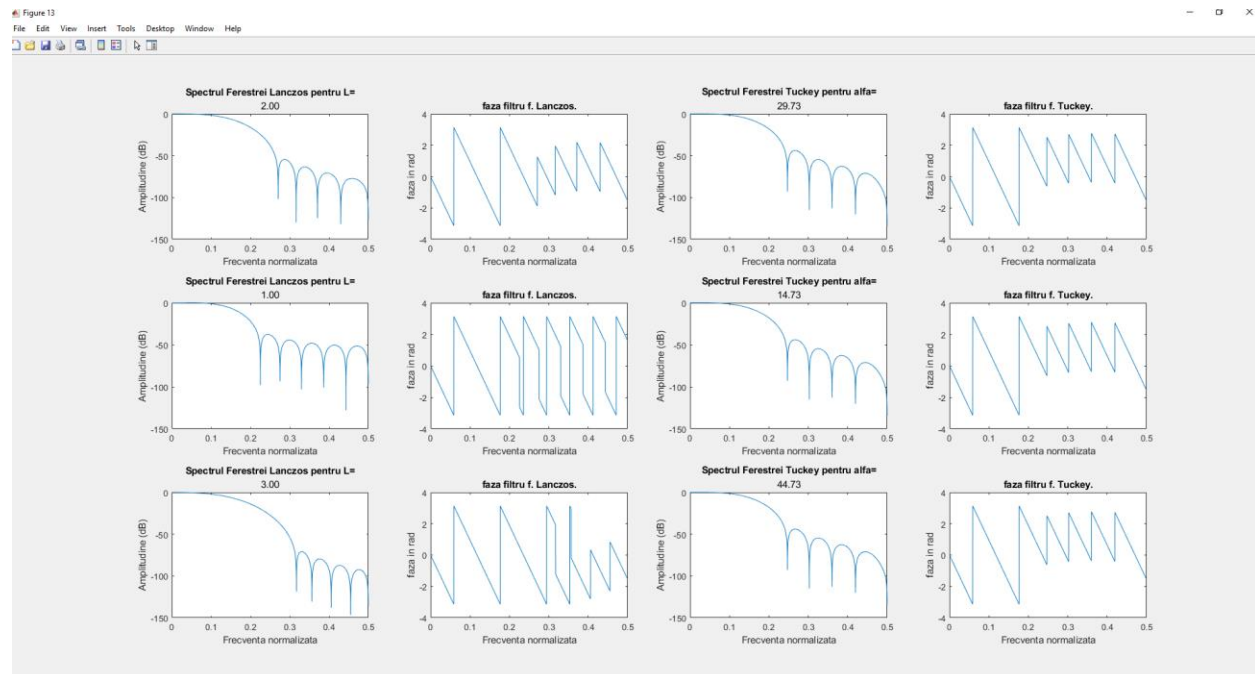

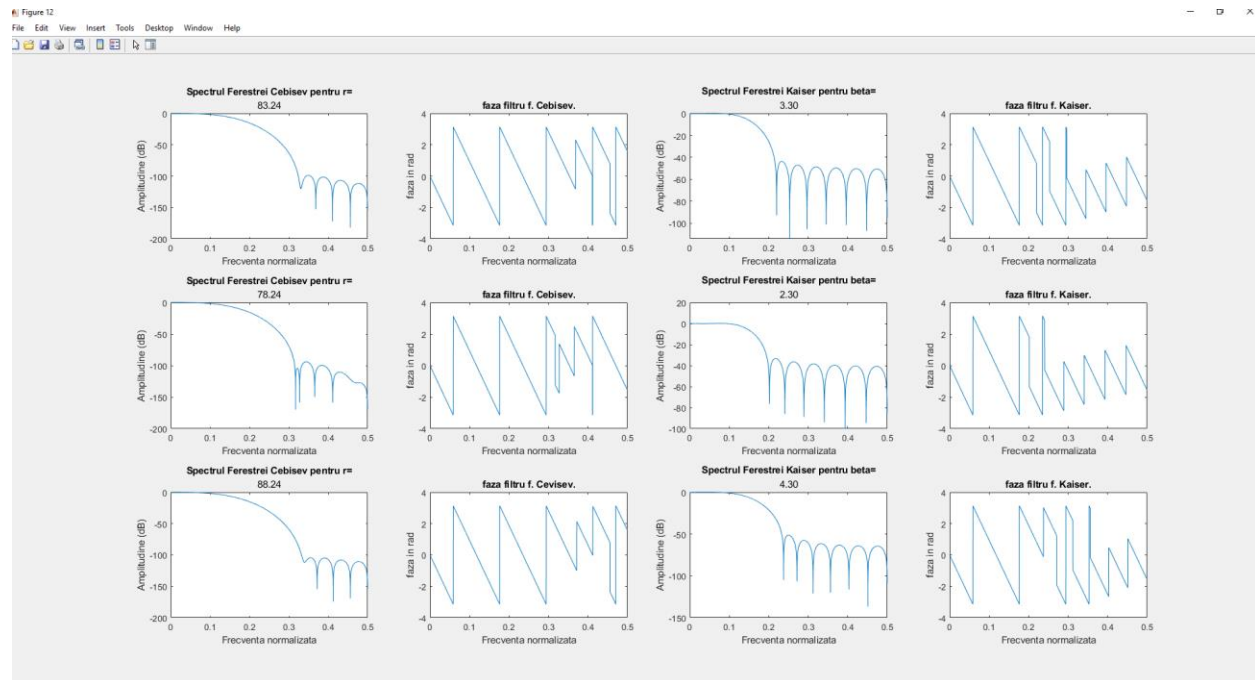

Lobul principal ingust, si valorile lobilor secundari scazute, o fac o fereastra calitativa.

## Faza 2:

a)

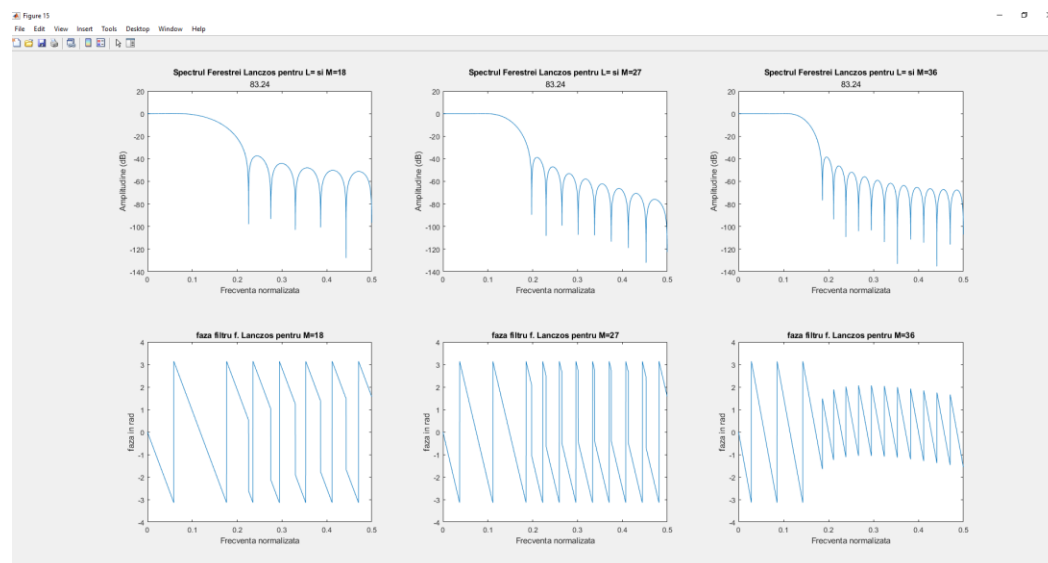

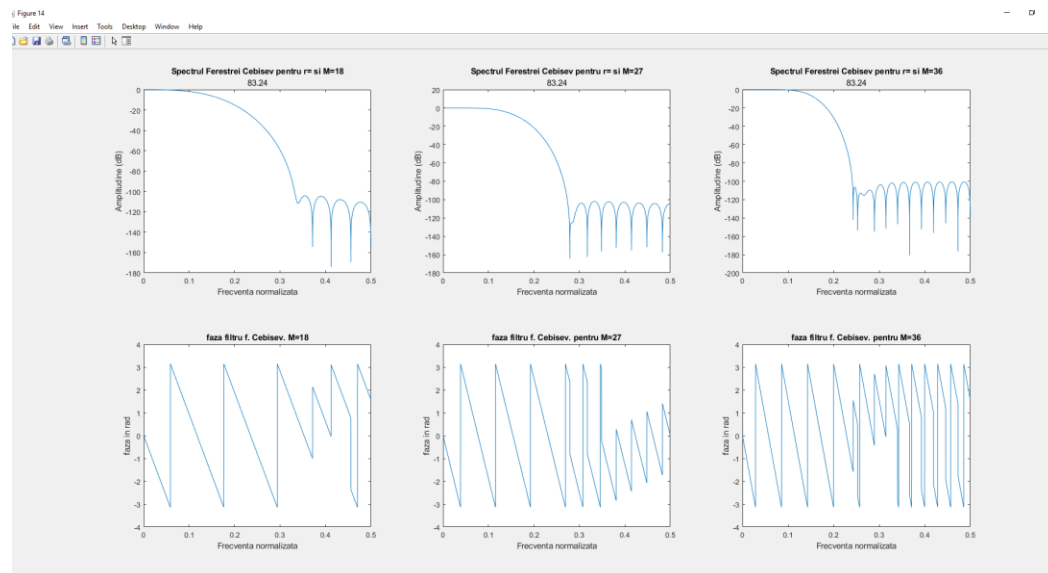

- 1.Cebisev pentru  $r+5$
- 2.Cebisev pentru  $r$
- 3.Cebisev pentru  $r-5$
- 4.Kaiser pentru  $\beta+1$
- 5.Kaiser pentru  $\beta$
- 6.Kaiser pentru  $\beta-1$
- 7.Lanczos pentru  $L+1$
- 8.Lanczos pentru  $L$
- 9.Lanczos pentru  $L-1$
- 10.Tuckey pentru  $\alpha+15$

11. Tuckey pentru alfa
12. Tuckey pentru alfa-15
13. Blackman
14. Hamming
15. Hanning
16. Dreptunghiular
17. Triunghiular

Corespunde partial cu clasificarea de la tema; Fereastra Cebisev este in continuare pe primul loc, Kaiser pe locul 3. Blackman s-a clasat mai jos decat in topul din tema. In rest este destul de asemanator. Am ales aceasta ordine in functie de raportul dintre latimea lobului principal si inaltimea lobilor secundari.

b)

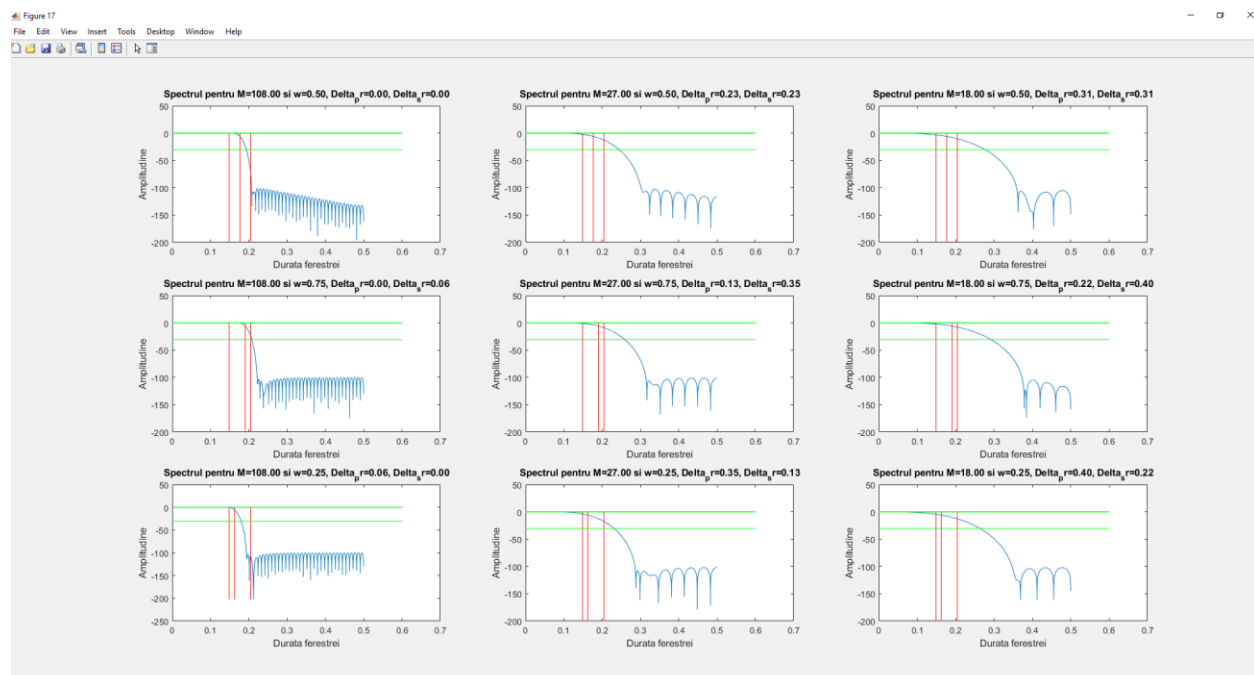

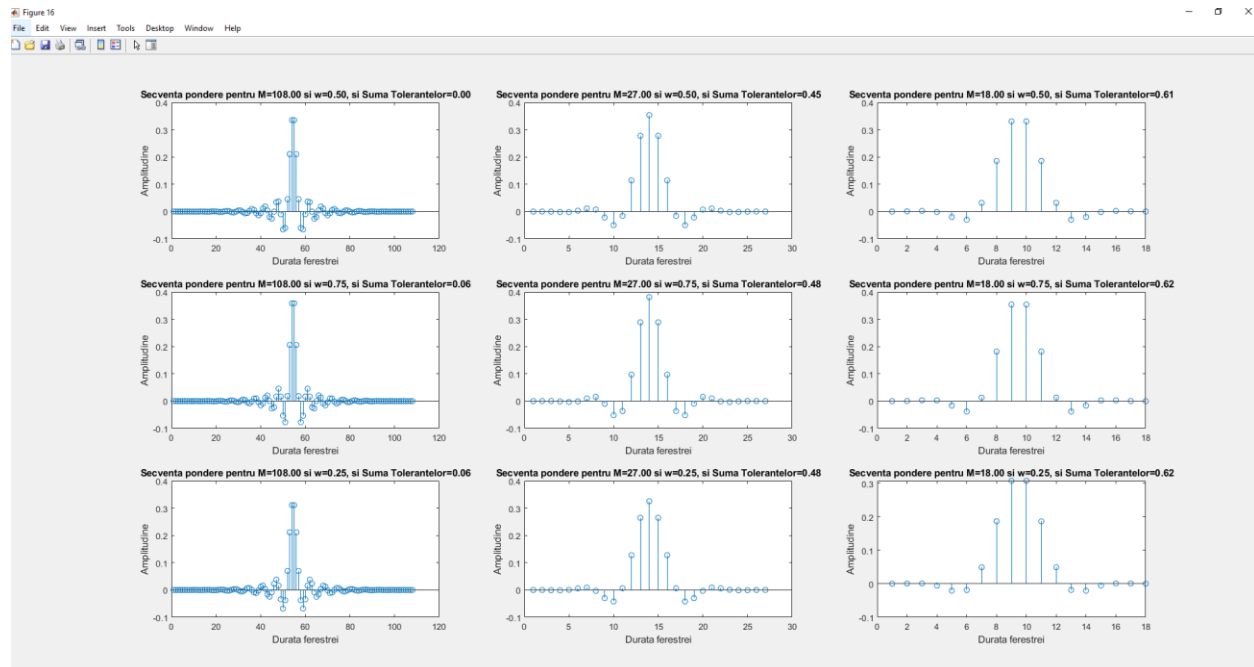

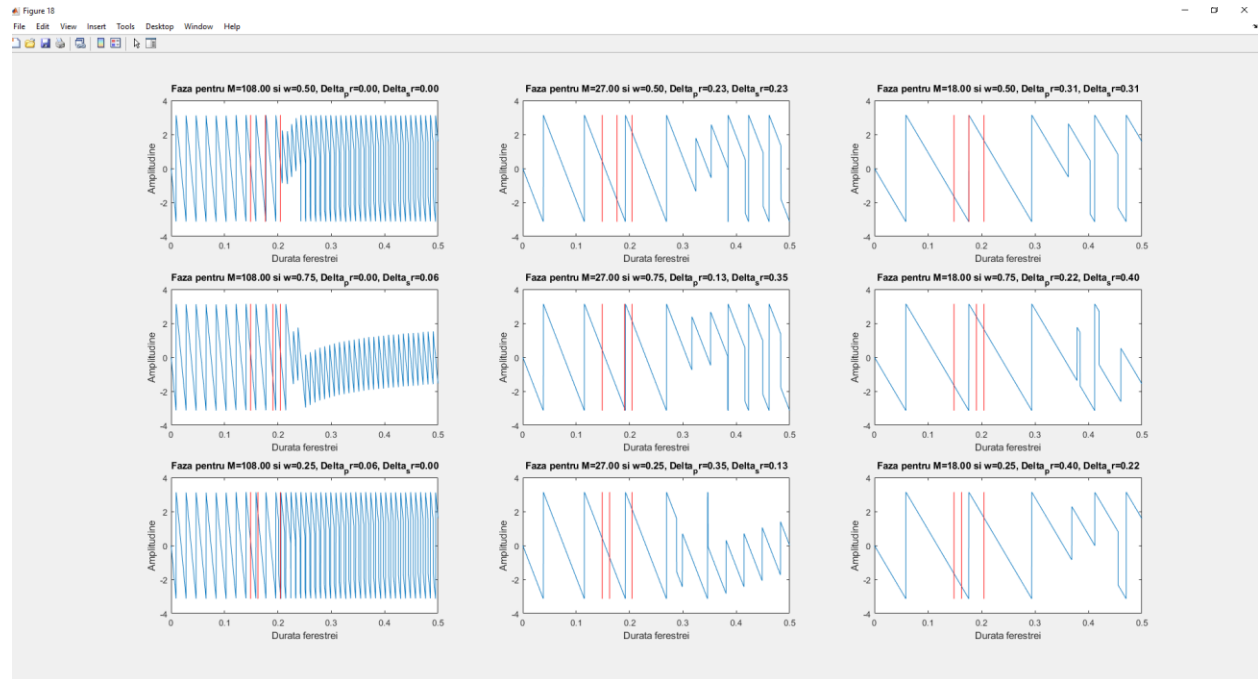

Cel mai slab filtru Cebisev este cel cu  $M$  initial = 18  
 Cel mai bun filtru Lanczos este cel cu  $2 \cdot M = 36$   
 Dar, in continuare filtrul ferestrei Cebisev va fi mai calitativ decat  
 filtrul ferestrei Lanczos, in ciuda modificarii  $M$  ului, tinand cont de  
 latimea lobului principal si valorile lobilor secundari
